

Four public starting points for Singapore AI.

A first pass at the question: where should someone begin when they want to understand the country's AI ecosystem?

By Superintelligence SG · Published 28 September 2026 · Version 1.1 Editorial analysis of public sources. Observations and interpretation are presented separately.

The question

Where should someone begin when they want to understand Singapore's AI ecosystem?

The map is easier to read as a set of entry points.

Singapore's AI landscape is not one list. Public programmes, research institutions, assurance work and adoption support answer different questions. This note puts those doors side by side so a reader can choose the next source to open.

What we observed.

The public record clusters around four jobs: build national capability, extend the research frontier, make systems testable and help organizations adopt AI in practice.

That structure is useful because it separates roles without pretending the boundaries are fixed. One institution can appear in more than one layer; this page records the public role described by its source.

Four starting points.

Each row names a public source, the structure it reveals and the next question it leaves open.

AI Singapore connects research, companies and talent.

AI Singapore describes a national programme that brings together Singapore-based research institutions and an ecosystem of start-ups and companies to perform use-inspired research, create tools and grow talent.

Why it matters This is a useful entry point for capability, programmes and talent. It does not tell us every organization working in Singapore.

NUS AI Institute makes the research layer legible.

The Institute groups its work into foundational AI, AI + X, and AI governance and policy, linking technical research to sectors and public questions.

Why it matters A research map helps a reader move from “who is doing AI?” to “what kind of question is being worked on?”

AI Verify Foundation turns trust into a testing layer.

The Foundation describes an open-source community for AI testing frameworks, tools and practices, including the Global AI Assurance Sandbox for real-world generative AI applications.

Why it matters Assurance is infrastructure for adoption. It gives builders and deployers a place to ask how a system behaves, not only what it promises.

IMDA's National AI Impact Programme frames adoption as capability.

IMDA says the 2026 programme will support enterprises and workers, including a target of 10,000 enterprises and 100,000 AI-bilingual workers over three years.

Why it matters Adoption is not only a vendor list. It includes skills, workflow change and the institutions that make implementation possible.

What the first map leaves out.

This is a public starting map, not a census. It does not yet show the full set of private vendors, community groups, funders, specialist labs or the lived outcomes of deployment. Those gaps are invitations for better sources, not missing rankings.

Follow the thread.
