From programme to practice.

28 SEPTEMBER 2026 PUBLIC SOURCES ADOPTION LAYER

A closer look at how Singapore's public AI agenda is being translated into enterprise workflows, practical skills and accountable deployment.

By Superintelligence SG · Published 28 September 2026 · Updated 15 October 2026 · Version 1.3

Editorial analysis of public sources. Observations and interpretation are presented separately.

The question

What does the public record tell us about how Singapore turns AI programmes into practical adoption?

Adoption is a workflow question.

The public record is moving beyond “who has access to an AI tool?” and toward “which work changes, who can change it, and what support makes the change durable?” This note follows that shift across enterprise data, national programmes and applied experiments.

What we observed.

Singapore's adoption layer has three connected parts: measure where firms are using AI, build the capabilities to redesign work, and give organizations a practical route from a problem statement to a tested system.

These parts do not make adoption automatic. They make the path more visible. The open question is whether the resulting systems improve work for the people who use and are affected by them.

Five signals.

Each row names a public signal, the structure it reveals and the question that remains open.

01 / BASELINE

AI use is spreading, but the depth of use varies.

IMDA reports that 14.5% of SMEs adopted AI in 2024, up from 4.2% in 2023; among non-SMEs, adoption rose from 44% to 62.5%. The same report describes firms using AI across several business functions, from IT and customer service to finance and accounting.

Read IMDA's adoption evidence ↗
(https://www.imda.gov.sg/resources/press-releases-factsheets-and-speeches/press-releases/2025/singapore-digital-economy)

WHY IT MATTERS

A headline adoption rate does not show whether AI is a pilot, a workflow layer or a system that changes accountability.

02 / CAPABILITY

NAIIP treats enterprises and workers as one adoption system.

IMDA's National AI Impact Programme aims to support 10,000 enterprises over three years and 100,000 workers to become AI-bilingual. Its mechanisms pair enterprise support with leadership training, pre-approved AI solutions and domain-specific fluency programmes.

Read MDDI's NAIIP factsheet ↗
(https://www.mddi.gov.sg/newsroom/national-ai-impact-programme--empowering-enterprises-and-workers-to-transform-with-ai/)

WHY IT MATTERS

The target is not only tool distribution. It links implementation to the people who must redesign and govern the work.

---

03 / EXPERIMENT

AI Singapore makes the problem statement the entry point.

AI Singapore's 100 Experiments FAQ asks whether a proposal is an AI use case, creates substantial value and has relevant, sufficient annotated data. It also considers available off-the-shelf alternatives and development feasibility. The FAQ states that only companies with IT, R&D or engineering teams in Singapore will be considered.

Read the 100E application criteria ↗
(https://aisingapore.org/faq/how-does-an-organisation-apply-for-the-100-experiments-100e/)

WHY IT MATTERS

A problem-led route helps separate a useful deployment from a generic demonstration. It also makes the organization's own capacity part of the design.

---

04 / FLUENCY

AI skills are being framed as domain practice.

IMDA's TeSA work under NAIIP describes AI fluency for tech and non-tech workers, with the aim of combining domain expertise and practical AI skills so people can transform role-specific workflows.

Read IMDA's NAIIP skills pathway ↗
(https://www.imda.gov.sg/how-we-can-help/techskills-accelerator-tesa/national-ai-impact-programme)

WHY IT MATTERS

"AI-ready" is more useful when it names the work a person can do, the judgment they retain and the risks they can recognize.

---

05 / EXCHANGE

SG AI Xchange puts implementation learning into the room.

At the 17 September 2026 launch, MDDI described SG AI Xchange as a place for companies to share how they approached AI adoption, including the problems they were solving, difficulties they met and changes made along the way. The opening address pointed to GlobalFoundries sharing its experience of scaling AI in manufacturing.

(https://www.mddi.gov.sg/newsroom/acting-minister-for-manpower-and-senior-minister-of-state-for-digital-development-and-information-ms-jasmin-lau-opening-address-at-the-official-launch-of-sg-ai-xchange/)

WHY IT MATTERS

Programme listings describe available routes. Implementation accounts can reveal the workflow, constraint and workforce questions that a route still needs to answer.

Turn the evidence into a next step.

1. Name the workflow. Choose one task, the people affected and the decision that stays with a person. This is an editorial starting point, rather than a programme eligibility assessment.

2. Compare public routes. Use **NAIIP in Navigator (https://superintelligencesg.com/directory.html?q=National%20AI%20Impact%20Programme)** to locate the programme, or **100 Experiments in Navigator (https://superintelligencesg.com/directory.html?q=100%20Experiments)** to explore a problem-led route. Check the official source for current requirements.

3. Make your organisation's work discoverable. If you represent an organisation, **publish its own Commons profile (https://superintelligencesg.org/#participate)**. Describe the actual work and what collaboration you seek. A self-published profile carries its own evidence status.

4. Improve the shared record. Send a missing public programme or a factual correction to the **Source Desk (https://superintelligencesg.com/source-desk.html)** with a primary source. This gives the next reader a better route through the ecosystem.

What this layer leaves out.

Public targets, programme descriptions and a ministerial opening address show direction and intended exchange, not independently measured outcomes. They do not yet tell us which workflows changed well, which workers gained or lost agency, or how results differ by sector and organization size. Those are the next questions for the Navigator and the Commons to document.

Version and corrections

1.3 · 15 October 2026 — Added the 17 September SG AI Xchange opening address as a fifth public signal. It describes a proposed exchange of implementation experience; it is not treated as evidence of adoption outcomes.

1.2 · 7 October 2026 — Linked the ministry's original NAIIP factsheet, clarified the published 100E assessment criteria, and added practical routes through Navigator,

Commons and Source Desk. The adoption figures remain explicitly about 2024; programme targets describe announced intentions rather than achieved outcomes.

1.1 · 28 September 2026 — Added citation tools, a downloadable brief and links to the related public index. The research claims are unchanged from version 1.0.

1.0 · 28 September 2026 — Initial publication based on the sources listed above.
